

MHT stuff

1. Event : breakdown/split of coherence around 2009

By lea Sophie dietz

●

MHT cross correlation:

- Before 2009: high correlation throughout Atlantic south of 35°N
- Then pattern shifts and moves southwards, splits into two boxes around 2009
- Two covarying boxes stays until 2013

MHT Coherence / correlation break 2009 - 2013

- Here we see signal goes from covarying and **in phase** to **anti correlated**, phase **shifted by π**
- split north of 5°N
- High amplitudes for southern signal

(Before 2009 also more or less in phase, some years a little less but not this strong split as here)

HF anomalies

- Around 2010 very strong positive HF anomaly (strong uptake) around equator
- Followed by negative anomalies (heat released) middle of 2010-2011
- Coherence break around these latitudes

HF anomalies

- Negative anomaly north 26°N

In phase again ~2013-14

- Signal is ~in phase again around mid-2013
- Very high correlation reaching over the equator up to 26°N
